Case Study: People Analytics at Monami Impex Ltd

Introduction - Md Rifat Rahman (1000054675)

Monami Impex Ltd. has been around since 1982 and has steadily become one of Bangladesh's top manufacturers and exporters of jute products. From yarn to sacks and food-grade bags, the company produces a wide range of eco-friendly products that are in demand both locally and internationally. What sets Monami apart is its commitment to quality and sustainability, which has allowed it to build a strong reputation over the years.

Figure 1: Monami Group Service Years.

But even with its success, Monami is facing some growing pains. As the company has expanded, its HR processes have stayed the same, and that's becoming a problem. Right now, a lot of HR tasks are handled manually, from collecting resumes through email to the informal onboarding process. These methods worked fine in the early years, but now they're slowing things down. Recruitment is taking too long, and performance tracking isn't as consistent as it should be. As Monami looks to grow further, these issues are becoming harder to ignore.

It's clear that something has to change. For Monami to continue expanding and staying competitive, the HR department needs to modernize. People Analytics could be just what the company needs. People Analytics is a way of using data to make smarter HR decisions—whether it's about recruitment, employee performance, or retention. By looking at real data rather than relying on gut feelings, Monami could make better decisions and improve how it manages people.

One tool that could help Monami with this is SAP SuccessFactors. This is an HR platform that can automate many of the tasks that are currently being done manually. Things like recruitment, onboarding, and performance management can be handled in one place. This would save HR staff a lot of time, allowing them to focus on things like employee development and engagement. With SAP SuccessFactors, Monami could get better insights into how things are going with its employees—whether it's tracking performance in real time or seeing which areas need improvement.

The great thing about People Analytics is that it's all about making better, data-driven decisions. For example, if SAP SuccessFactors shows that a particular department has high turnover, HR can step in and figure out why. Or, if certain employees are consistently doing well, the company can take steps to help them grow even further. With People Analytics, HR can make decisions based on real evidence, which is a huge step up from the guesswork involved in the current manual system.

As Monami continues to grow, both in Bangladesh and internationally, it will need a more efficient way of managing its workforce. The company's HR processes can't remain as they are when it's expanding across borders. People Analytics will allow Monami to centralize its HR systems, which is key for a company that's spread out across different locations. No matter where an employee is, they'll have access to the same system and support, which helps keep things consistent across the board.

Of course, no change comes without challenges. Some employees may have concerns about privacy when it comes to their data. And switching to a new system will mean some training is required. But with a clear plan in place, these challenges can be managed.

In the end, Monami Impex Ltd. is at a turning point. It has done well so far, but to keep growing and competing globally, it's time to update the HR processes. People Analytics through a system like SAP SuccessFactors could streamline operations and make the company's HR more efficient, smarter, and aligned with the company's overall goals. While it won't be a quick or easy transition, the potential benefits—better decision-making, a more engaged workforce, and greater efficiency—make it well worth the effort.

Methodology - MD Showrav Zaman (1000055235)

Participant Recruitment

For this case study, we recruited participants from four key departments of Monami Impex Ltd.: Executive Director (ED), Accountant (Acc), Export, and Human Resources (HR). We conducted four in-depth interviews, one from each department, to capture perspectives on the implementation and impact of the People Analytics system (SAP SuccessFactors). We employed a snowball sampling method, beginning with senior management and extending through referrals to other relevant stakeholders. We chose this approach because it allowed us to access participants with specialized knowledge, ensuring a diverse range of viewpoints from different organizational levels.

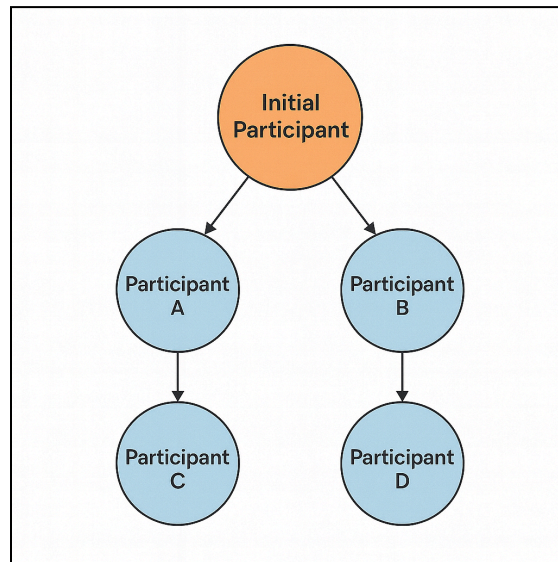

Figure 2: Snowball Sampling.

Interview Data Collection

For this case study, the data was primarily collected through 4 in-depth interviews conducted with participants from key departments: Executive Director (ED), Accountant (Acc), Export, and Human Resources (HR). Each interview focused on specific aspects of the People Analytics system (SAP SuccessFactors) and its impact on various functions within Monami Impex Ltd. The following interview questions were asked:

Department	Interview Questions
Executive Director (ED)	1. When did the business start? 2. Who are your biggest buyers? Are they mostly dealers, distributors or direct customers and what kind of products do they usually purchase the most? 3. What are the pros and cons of your business model? 4. Where do you see the best profit and the most significant loss? 5. What are the best-selling and least-selling products? 6. Why did you choose this business? 7. Why this product line?
Export	1. What is the typical shipment duration for your exports? 2. How do you communicate with buyers regarding payments and shipping? 3. How do you coordinate with jute mills for supply and pricing? 4. Can you describe the role of the bank officer in handling Letters of Credit (LC)?
Accountant (Acc)	1. Can you explain the VAT-tax procedure at Monami? 2. What is the transaction procedure for exports?
Human Resources (HR)	1. What challenges did you face when adapting to the People Analytics system? 2. What improvements have you noticed in the quality of data and decision-making since adopting People Analytics?

Table 1: Case Study Interview Questions.

We chose these questions (Table 1) because they aim to capture the strategic, operational and financial impacts of People Analytics (SAP SuccessFactors) on Monami Impex Ltd.. These questions provide insights into how the system enhances decision-making, improves efficiency, and drives performance management across various departments. By focusing on the challenges faced during adoption, the effectiveness of the system in improving data quality, and its ability to streamline HR processes, the questions help us evaluate the overall success and future potential of the People Analytics system within the company.

The data from these interviews were used to gather qualitative insights into how People Analytics is impacting various operational areas of the business, focusing on system adoption, challenges, and improvements.

Data Analysis

We transcribed the interviews and applied thematic analysis to identify recurring patterns. The themes were grouped into three main categories:

1. Strategic and operational impacts of People Analytics.
2. Financial management and compliance processes.
3. HR transformation and employee adaptation.

Ethical Considerations

During the study, we followed strict ethical standards. Participants were informed of the purpose of the research and volunteered to participate. They were assured that no identities or responses would be disclosed and that all the information was safely stored and no one but the research team should access any of the information. Participants were also free to leave any time. These steps made sure that our research upheld the rights of the participants and that it did not compromise on academic integrity.

Literature Review - Sara Tayba Rahman (23264004)

People Analytics has significantly transformed the Human Resources (HR) landscape by shifting the focus from intuition-based decision-making to evidence-driven strategies supported by data. Traditionally, as Madhu (2019) points out, HR was largely seen as an administrative function that managed employee relations, payroll, and compliance, with limited emphasis on data analysis or strategic contribution. However, with the advent of People Analytics, HR has evolved into a proactive and strategic partner within organizations, contributing directly to business growth and long-term success.

At its core, People Analytics empowers HR professionals to make informed decisions by analyzing vast amounts of employee-related data, ranging from performance appraisals and self-assessments to engagement surveys, attendance patterns, and even workplace behavior

metrics. By consolidating and interpreting these diverse data points, HR teams are now able to identify patterns, predict workforce trends, and develop targeted strategies that align more closely with organizational objectives.

This shift toward data-driven HR practices not only enhances accuracy in workforce planning but also supports predictive insights—for example, forecasting employee turnover, identifying high-potential talent, or evaluating the effectiveness of training programs. As Lipkin (2015) emphasizes, such practices help ensure that HR's actions are strategically aligned with broader business goals, thereby maximizing organizational performance. Ultimately, People Analytics has transformed HR from a traditionally operational role into a critical driver of organizational strategy, innovation, and competitive advantage.

Findings: Company and Problem Background - Raisul Islam Opu (24341319)

Monami Impex Ltd. was started in 1982, and it has developed into one of the leading manufacturers and exporters of jute products in Bangladesh. The product range of the company covers both jute yarn and twine through food-grade bags and hessian sacks. Although it has a good reputation and successful performance in the industry, Monami has a major problem in the area of human resources (HR) processes. These processes have been largely manual and disconnected over the years thus, preventing the company to scale effectively.

The HR department at Monami is already mired in inefficiency. Recruitment, in particular, has been repeatedly held up due to the manual nature of the process, where resumes are received either via email or face to face and vacancies are not readily available to those interested in the position. The onboarding process is also very relaxed and ad hoc, as there is no standardized process in the process of welcoming and integrating new members in the company. This leads to confusion of new employees and the HR team wastes more time handling such inconsistency.

Besides these difficulties, there is no proper system of monitoring the performance of employees. Without clear performance data, the HR cannot assess employee development and play its part in professional development. Employees are not provided with consistent and practical feedback that would assist them to do better. This lack of a centralized HR system has contributed to more inefficiencies when it comes to HR since it can not communicate efficiently with other departments. Critical information that is not shared across teams because it is siloed makes it difficult to make data-centred decisions. These problems directly affect the capability of the

company to cope with the increasing number of employees and, finally, its ability to expand itself.

Discussion - Raisul Islam Opu (24341319)

The information obtained on this section is through detailed interviews with the HR team of Monami and a questionnaire that was sent to the employees at different departments. These data sources demonstrate the challenges Monami has and the opportunities that may be offered by the implementation of the more modern and data-driven HR system such as SAP SuccessFactors.

Analysis of Interview

When they were interviewed about the HR Manager, they highlighted that SAP SuccessFactors had simplified the recruitment, onboarding and setting of goals in the company. These areas were not as efficient before the implementation of SAP, recruitment used to take longer than expected and integration of employees was a mixed experience. Since SAP SuccessFactors has been introduced, the HR Manager noted that the recruitment process is now much faster. Applicants can now apply online very easily, and applicants can be tracked and resumes reviewed as rapidly as possible by hiring managers. Onboarding has also become systematic and organized, as new employees are now well welcomed into the firm and given the appropriate resources and their role. Also, the goal-setting aspect of the system has ensured that employees have an outlook of their performance and performance benchmarks to strive towards the attainment of company goals. The HR Manager emphasized that in this alignment, measuring the goals set and which can be followed up over a period has contributed in enhancing the performance in the overall sense. The software has enabled the HR operations to be more efficient, organized and linked well with the larger objectives of Monami.

Recommendation - Raisul Islam Opu (24341319)

Enhance Transparency

Since data privacy is a major issue that several employees have expressed concern over, it is important that Monami explains how employee data will be utilised. The company ought to explain clearly the intention of gathering and analyzing data and what security measures are available to guard the same. Frequent changes and transparent communication on data policy would be a long way in gaining trust among employees. By ensuring that employees have information on how their data are being utilized like enhancing HR to better HR processes or formulating more personalized development plans, anxiety will be minimized and employees will be more encouraged to buy into the system. Moreover, the development of the clear data access and retention policy will allow reducing concerns and ensuring transparency during the implementation process and after it.

Invest in Training

Among the recommendations that should be made in priority is the increased investment in training of all the employees. Although SAP SuccessFactors has numerous strong features, the employees stated that they did not know how to use some functions because of the lack of training. To make sure that every employee, including HR personnel and others, feels free and at ease with the software, Monami ought to implement detailed training programs. The training needs to be specific to various groups in the company, the HR personnel would require the more in-depth training on features of the system such as performance tracking and goal-setting, and other departments might require training on accessing major reports and data. Moreover, continuous assistance and refresher training must also be provided so that the employees are able to constantly increase their digital capability and keep in touch with software updates or any new functions.

Focus on Collaboration

Last, although People Analytics can bring great advantages, Monami needs to be more collaborative in the way it implements it. This does not only imply the use of the software to address all HR issues, but it should also be used in conjunction with the contribution and feedback of managers and team leaders. Frequent liaisons between HR and other departments are

fundamental in ensuring that data received by the SAP SuccessFactors can be utilized well. The HR should engage in close collaboration with managers, in goal-setting and performance discussions and should ensure that the software is meeting the correct needs. A less exclusive and more collaborative strategy would assist in making People Analytics more efficient and make sure that it is capable of contributing to the overall development and improvement of the company.

SWOT Analysis - Raisul Islam Opu (24341319)

Strengths:

Improved HR Efficiency

The major opportunity of applying People Analytics, especially, SAP SuccessFactors, is the fact that the efficiency of HR processes improves dramatically. The HR Manager also noted that recruitment is simplified, onboarding is simplified, and goal-setting is simplified. The automated system has substituted the manual recruitment process and has enabled applications to be received electronically and resumes to be checked promptly. Onboarding is now more systematic as it was previously unstructured and also new employees are welcomed and integrated.

Impact: This operational change has led to the reduction in the time spent on recruiting, improved organization onboarding, and better performance tracking. It enables the HR personnel to work on more strategic areas, including employee development and engagement.

Data-Driven Decision Making

People Analytics will enable HR to make informed and data-driven decisions. The HR activities before the application of SAP SuccessFactors used to depend on manual operations and subjective reviews. People Analytics, in turn, will help Monami monitor the performance of its employees in real time, pinpoint their weaknesses, and make decisions supported by data. Predictive features of the software allow the company to anticipate the turnover and detect fine prospective talent, which aids the recruitment and retention approaches.

Impact: This change in decision-making based on gut to data aids in increasing the capacity of the firm to detect trends, proactively change direction and align with the overall organizational objectives.

Scalability for Growth

The necessity to have a scalable HR system is of paramount importance as Monami continues to grow its operations at both local and international levels. The centralized site provided by SAP SuccessFactors is able to process the HR functions of different departments and locations. This will make sure that regardless of where the employees are, in Bangladesh or elsewhere, they can use the same system and receive help that will result in increased stability in HR operations.

Impact: The capacity to control HR processes through a central system will be central in the continuation of the growth and globalization of Monami. This is the scalability which enables Monami to maintain its HR activities in tandem, irrespective of the geographical location.

Weaknesses:

Data Privacy Concerns

Their concern on data privacy is one of the most important weaknesses that employees have been found to have. As the more data-driven strategy is adopted, employees fear the usage of their personal information and the possibility of its safe storage. Such an issue may cause opposition to the new system, and may destroy trust in the organization. The employees should be assured of ethical use of their data.

Impact: Privacy concerns about data may present an obstacle to the complete integration of the People Analytics system. These issues could make the employees unwilling to cooperate with the system, which is why they should be addressed properly.

Lack of Sufficient Training

Even though the capabilities of SAP SuccessFactors are strong, a considerable part of the workforce is not ready to operate the software efficiently. Some employees have not received sufficient training and are therefore not sure how to operate some important functions, including performance tracking and goal-setting. The system will fail to achieve full potential without equipping the employees with the required skills to navigate the system.

Impact: The lack of proper training may lead to inefficient utilization of the software, which will decrease the efficiency of the HR department in general and prevent any engagement with employees. In order to maximize People Analytics, Monami will have to invest in detailed training and ongoing support.

Resistance to Change

There is a major organizational cultural change in implementing People Analytics. Lots of employees are used to traditional HR practices, and transition to the data-driven model can be resisted. The new system may be considered intrusive or too clinical by some employees and managers and thus this may result in resistance to the complete adoption of the system.

Impact: Resistance to change may also slack the implementation process, thus causing inefficiencies within the transition process. The resistance will have to be overcome with the help of effective leadership, clear communication and a change in the culture that will present people analytics as a means of empowering employees and not controlling them.

Opportunities:

Enhanced Talent Management

People Analytics gives Monami a chance to enhance talent management by enabling the HR department to know who is a high potential employee and designing development programs based on these. Through historical data of employee performance, Monami will be in a better position to predict the most successful candidates in certain positions and thus pursue improved talent acquisition and retention policies.

Impact: This type of talent management is a type of data-driven solution that can result in an advantageous hiring process, lower turnover, and enhance employee engagement. It also helps Monami to create an environment of unceasing development that is the key to growth and innovation.

Better Employee Engagement

As their performance monitoring improves and the feedback is more organized, the workers of Monami are able to be better informed about their performance and the areas in which they underperform. Such openness may result in a higher morale and participation as the employees are more informed about expectations and growth opportunities.

Effects: When the level of employee engagement is higher, the level of productivity increases, as well as turnover and the company culture. People Analytics can assist in constructing a more meritocratic setting where workers are made to feel appreciated and strive to bring the business to success.

Reduction of Costs in HR procedures.

Automation of major HR activities including recruitment and onboarding processes can save a lot of time and resources that are used in manual activities. This efficiency in operations is in the form of cost savings to the company. In addition, enhancing recruitment and retention will enable Monami to prevent the expenses of making a bad hiring decision and losing employees.

Impact: HR processes will be simplified, which will enable Monami to put resources into the right areas to focus on strategic business areas that will lead to long-term growth and profitability.

Threats

Technological Failures

There is a threat of technological failures due to the use of SAP SuccessFactors and dependence on People Analytics. Problems like system bugs, inaccuracy of the data or sluggishness may interfere with the HR functions of the company and impair its capacity to take timely decisions. SAP SuccessFactors is a solid platform but nothing is resistant to technical difficulties.

Impact: Delays in recruitment, onboarding and monitoring performance will happen as a result of any interventions in the People Analytics system, which will eventually impact the productivity and growth of the entire company. To reduce this risk, a good technical support plan and contingency measures will be necessary.

Over-Reliance on Data

Although HR processes may be improved through data-driven decisions, there is the risk that Monami would become dependent on data and not view the human part of HR. Decision-making should be supported with the help of People Analytics rather than be substituted by it. Excessive data focus can cause the decrease of individual contacts with the staff, which can influence morale and engagement.

Effect: The excessive use of data may make HR seem colder to employees as they will be left unsatisfied since they may feel that they are not individuals but rather numbers. Striking a balance between decision-making that is based on data and the human touch will be one of the factors needed to sustain good organizational culture.

Legal and Ethical Issues

Monami has to ensure it is cautious of the legal and moral consequences of working with employee data as it goes towards a more data-driven HR system. Legal legislation, including GDPR, might be applicable to employees when operating in other parts of the world, and breach of such laws might lead to legal action and loss of reputation to the company.

Consequence: Violating data privacy may attract legal settlement, financial fines and trust depletion among employees. It is important that Monami should not violate any of the applicable regulations and create rigorous data security policies to safeguard employee data.

Conclusion - Mehbub Shifat Ur Rasul (1000055399)

In a world that is becoming more and more globalized, Monami Impex Ltd. is at a crossroad with its future of emerging as a successful international firm, dependent on its capacity to transform its fundamental operational structures. The above discussion has elaborately explained the strong argument of strategic change in human resource management practices, that is, the shift away to the reactive approach to the proactive approach that is driven by the power of Data in the form of People Analytics. Such a system is not just a technological upgrade but a total re-thinking of the process by which the company finds, develops and maintains the talent that it needs to get it through the intricacies of global expansion. This conclusion is a synthesis of the main arguments, again the strategic necessity of the People Analytics, and moves a prospective path of how Monami can fulfil its potential.

The details provided in this paper show that scalable and robust HR solution is not a luxury anymore but a necessity that Monami needs. The existing HR system of the company, which was adequate in terms of its domestic business, is unprepared to address the massive increase in the number of employees and cultural subtleties of the new market entry. Devoid of a methodological way of gathering and evaluating data, the essential decisions on recruitment, performance management and talent development would continue to depend on guts and anecdotal evidence. Such impossibility of empirical foundation might result in optimal recruitment, turnover rates in new locations, and inability to leverage the multiculturalism of a multinational workforce. People Analytics gives the required structure to defeat these challenges by repositioning the HR function as a strategic business partner rather than a cost center. Through the use of data, Monami is likely to anticipate the staffing requirements precisely, define the essential competency gaps, and align the acquisition of the talents with the specifics of the local market requirements.

A People Analytics framework has a concrete payoff in several areas of HR, which are discussed in the body of the paper. In the hiring process, e.g. in the hiring exercise, data-based methodology can be relied upon to determine the long-term success of the candidate, not just on the surface of his/her resume. Through historical analysis of employee performance, turnover, and skill acquisition, Monami will be able to develop predictive models to determine the attributes and experiences which have the highest likelihood of resulting in high-performance and loyalty in its particular cultural environment. This does not only make hiring easier but also the costs involved in hiring wrongly are greatly reduced. Likewise, in the context of performance appraisal, People Analytics provides a more objective and fair system. The company may use

data on the key performance indicators (KPIs), peer feedback, and project results to develop a comprehensive and impartial picture of the employee contribution instead of basing the ratings on subjective managers. This increased transparency and fairness has the potential to improve morale in employees, engage them, and create a sense of accountability.

Nevertheless, the process of converting to a data-driven HR model does not occur without any difficulties. The paper has brought out the crucial role of a staged implementation plan that meets not only the technological but more so the cultural challenges. An effective integration entails a large amount of investments in technology, such as an effective Human Resources Information System (HRIS) that can help centralize the data provided by different sources. The cultural change that will have to take place in the organization will be the greatest challenge other than the technological infrastructure. The employees and managers might be too anxious to accept a system that they find to be intrusive or too clinical. Hence, a detailed change management strategy is necessary, including open dialogue about the advantages of the new analytics and the provision of comprehensive training regarding the use of the new tools as well as the presentation of how the information will be applied to help employees become more influential and not to control them. By positioning the initiative as a means of developing a more meritocratic and accommodative workplace Monami will be able to achieve buy-in and convert an initial resistance into a passionate adoption.

To sum up, the path of Monami Impex Ltd. to global leadership cannot be achieved without the capability to cope with its most precious resource, which is human resource. The adoption of the People Analytics solution is the strategic necessity that will help the company to get beyond the reactive HR practices and create a proactive, resilient, and flexible workforce. With a careful approach to the cultural and technological issues, Monami will be able to use data to empower every aspect of its HR activities, including the recruitment of the best employees and the creation of a learning and development culture. The way ahead is obvious: data-driven HR strategy is the framework on the basis of which Monami will create its sustainable global enterprise. It will not only see that the right people are in the right positions at the right time, but also the organization is positioned to cater to the future needs of the ever-changing global market place. This is more than a simple HR investment in People Analytics, then, it is a statement of how Monami believes in smarter growth and continuing prosperity at the global level.
